Plan B: The Show Must Go On

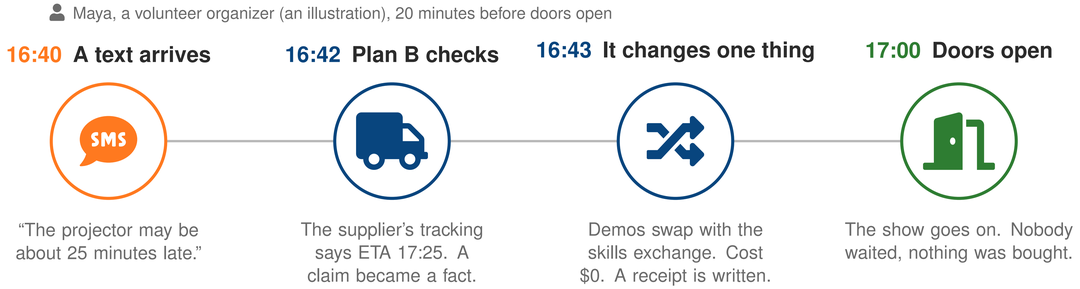

Noctis Zhang

University of Massachusetts Boston • PEAAII Hackathon, October 2026

An AI event coordinator that decides what to verify, what to prepare, and when to commit a change

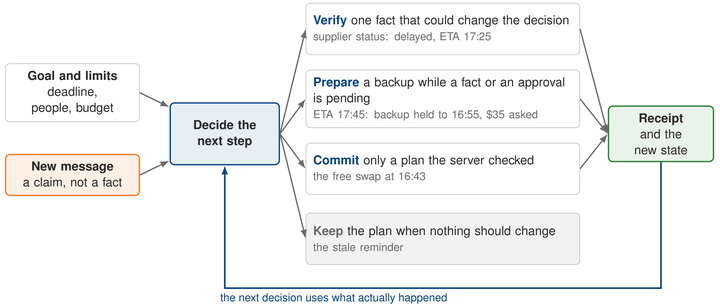

Tested on new cases it had never seen: 59 of 60 runs reached the right outcome, and no executed action broke a limit.

Twenty minutes before doors open, the projector may be late

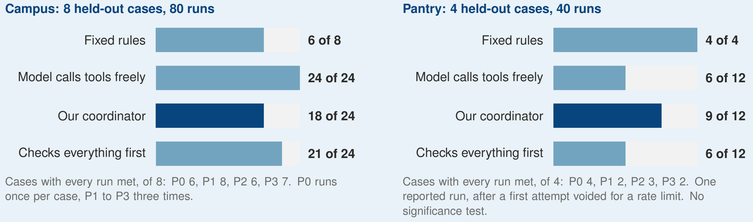

Plan B checks before it changes anything and leaves a receipt. A stale reminder **changes nothing**.

The model chooses, the server checks

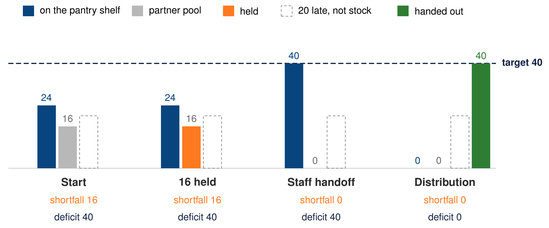

The model picks from options the server checked. One gate writes every **receipt**.

Tested on cases it never saw

The first test on **12 unseen cases** exposed **three defects**, now fixed. On **6 new cases**, every model policy met every run.

The same loop in a fictional pantry

Late stock does not count, and only staff record a handoff. **No kit was counted twice.**

What I built

A local server and board, a checked executor, a planner, four policies and a frozen test harness.

What is next

Live data such as MBTA transit alerts, more test cases, and a pilot with community staff.
